

I played around with Flutter (for native app) and Figma (for wireframe prototypes) for 10 hours in the context of making Journal for feelings.

- I started with User research, and interviewing people was interesting. I learned that what I think is normal cannot be same as what other people think is normal. I assumed that everyone would appreciate journaling but realized that not everyone likes reflecting their lives.
- The instructor that I took courses from is Dr. Angela Yu, and I found out that she has multiple coding courses that she is teaching on Udemy Online Classes. Surprisingly, when I searched her on Linked-in, she is a doctor practicing medicine in UK! I learned that coding really can be for anyone who is passionate to learn and practice.
- I learned that I really like Flutter and how it is structured. There are not many sources on debugging, so it was little challenging, but I would really like to see how big it can be in the future.
